Overview and Research Objectives

The Kern Council of Governments commissioned Godbe Research to conduct a telephone survey of residents of Kern County with the following research objectives:

➢ Gauge residents’ overall opinion of current and future quality of life in their city or town;
➢ Survey the importance of specific issues related to future quality of life in the County;
➢ Understand the daily commute behavior of the average resident;
➢ Determine housing preferences; and
➢ Identify any differences in opinion due to demographic and/or behavioral characteristics.
Methodology Overview

➢ Data Collection  Telephone and online interviewing
➢ Universe  609,827 adult (age 18 or older) residents of Kern County
➢ Fielding Dates  January 28 through February 12, 2017
➢ Interview Length  22 minutes (Phone)
➢ Sample Size  1,328 (Email/online=254; Cell=314; Landline=707; Text/online=53)
  84 interviews were conducted in Spanish
➢ Margin of Error  ± 2.69%

Note: Data is weighted to the 2015 American Community Survey (ACS) for gender, age and ethnicity, and weighted to the 2010 Census data for region.
Executive Summary
Executive Summary I

➢ The survey showed the third highest level of satisfaction with the quality of life among Kern County residents measured by any survey from 2008 to 2017, with 84 percent indicating they are satisfied. Statistically, there is no difference among the respondents since 2012. Further, results continue the trend, that the opinion of the quality of life has exceed 80 percent in each year after 2011.

➢ Looking ahead to the next 20 years, 38 percent of the residents surveyed think the quality of life in their city or town will be “much better” or “somewhat better”. This is numerically lower than 2016, but statistically equivalent. Thirty percent think it will “stay about the same,” and 27 percent think it will be “somewhat worse” or “much worse.”

➢ In an open-ended format, the “small town atmosphere” continues to be the thing that respondents cited that they liked most about where they live (41%), and “sense of community” is second (25%), “cost of living” is third (24%). Contrastingly, “air quality” remains the thing they liked least about their city or town (32%) and followed by the “crime rate”, which is almost the same (30%).
The 2017 survey assessed the importance of 20 issues in improving the future quality of life in Kern County. The top rated issues for 2017 were:

- Preserving water supply (3.67, on a scale of 4 to 0)
- Improving the quality of public education (3.60)
- Improving crime prevention and gang prevention programs (3.55)
- Improving air quality (3.46)
- Creating more high paying jobs (3.45)
- Improving water quality (3.43)
- Maintaining local streets and roads (3.41)

Slightly lower than in 2016, but not statistically significant, the results show just slightly less than 3 out of 4 residents typically drive alone in their commute to work or school (74%). Twenty-four percent indicated that carpooling was their secondary mode choice, numerically, but not statistically higher than 2016.
Thirteen percent of respondents rated traffic flow as “Excellent”. Forty-three percent of respondents rated traffic flow as “Good”, while 34 percent rated it as “Fair” and nine percent said it was “Poor”.

Seventy-three percent of residents reported a commute of 40 minutes or less in 2017, compared to 68 percent in 2016 and 66 percent in 2015.

Sixty-one percent of residents reported a commute of 20 miles or less in 2017, compared to 60 percent in 2016 and 62 percent in 2015.

Respondents who drive alone were also asked if they would take an alternative if it were available. Thirty-three percent indicated they would continue driving alone, compared to 27 percent in 2016, 32 percent in 2015, and 30 percent in 2014. Just 25 percent also said they would car or vanpool.

Just seven percent of respondents indicated they had used a freeway call box in the last 12 months. Those 60 years or older were only slightly more likely to have used a call box than those 59 or less.
The largest plurality of respondents indicated they currently live in a single-family home with a large yard (47%), while 39 percent indicated they reside in a single-family home with a small yard, 10 percent live in an apartment, and three percent live in a townhouse or condo.

The largest majority of respondents (80%, definitely or probably) indicated they would prefer a single-family home with a large yard. Secondarily, 77 percent chose a single-family home with a small yard. While 43 percent indicated they would prefer a townhome or condo, and only 21 percent would prefer a condo in a mixed-use building.
Key Findings
Q1. Satisfaction with Quality of Life  
(n=1,328)

To begin, the first question of the survey asked residents to rate their level of satisfaction with the quality of life in their city or town. While, the 2017 survey results show a small decrease in the “Very satisfied” response and corresponding slight increase in “Somewhat satisfied” response when compared to 2016, the overwhelming majority of Kern County residents continue to be satisfied. Consistent with previous results, more than four out of five residents said they are satisfied with the quality of life, with only one in six residents indicating some level of dissatisfaction. Less than one percent did not offer an opinion or declined to answer the question (DK/NA). The chart on the following page compares the relative satisfaction with quality of life for 2017 at 83.5%, compared with survey results from 2016 (85.1%), 2015 (82.0%), 2014 (84.3%), 2012 (81%), 2010 (78%), and 2008 (79%).
Q1. Satisfaction with Quality of Life (n=1,328) Continued
When viewed in terms of gender, the data reveals that men were more likely to say they were “Very satisfied,” while women and those indicating a gender of “Other” had a higher tendency to indicate they were “Somewhat dissatisfied.”

Q2. Outlook on Future Quality of Life  
(n=1,328)

The respondents were then asked to predict whether they thought the quality of life in their city or town would become better or worse over the next 20 years, or if it would stay about the same. The 2017 survey data reveal a slight decrease in those who responded “Much better” when compared to 2016 (12.8% in 2017 vs. 17.4% in 2016). However, 38.3% of residents indicated the quality of life would be at least “Somewhat better,” compared with 41.4% for 2016. In contrast, 26.9% of residents predicted life will be “Much worse” or “Somewhat worse,” compared with 26.7% in 2016. Similar to previous results, 5.4% did not render an opinion (DK/NA).

The chart illustrating these results is on the following page.

Q2. Outlook on Future Quality of Life
Age Comparisons

In terms of comparison among age groups, residents ages 25 to 34 were more likely to report that they felt the quality of life would be “Much better” in the next twenty years. Residents ages 60 to 74 had a higher tendency to say they anticipated the future to be “Somewhat worse,” while those ages 25 to 84 were more likely to feel the future quality of life would be “Much worse.”

Hispanic or Latino residents were most optimistic, with a higher tendency to indicate they feel the future quality of life would be “Much better” or “Somewhat better,” and Asian residents were also more likely to say that the future quality of life would be “Somewhat better.” However, African-American or Black and Caucasian or White residents tended to report at higher frequency that they anticipated the future would be “Much worse.”

Next, residents were asked what they most liked about their city or town in an open-end format with multiple responses accepted. The most frequent response was “Small-town atmosphere” at 41.2%. The following tier of responses included “Sense of community” at 24.6%, “Cost of living” at 23.9%, “Location” at 23.8%, and “Cost of housing” at 20.7%. The third tier of responses included “Weather and climate,” “Safe neighborhoods / communities,” “Natural resources,” and “Farming and agriculture.” All other features garnered less than ten percent mentions.

The data is illustrated on the following page.
Q3. Most Liked Features of City or Town (n=1,328) Continued

- Small-town atmosphere: 41.2%
- Sense of community: 24.6%
- Cost of living: 23.9%
- Location: 23.8%
- Cost of housing: 20.7%
- Weather and climate: 14.9%
- Safe neighborhoods / communities: 12.2%
- Natural resources: 10.9%
- Farming and agriculture: 10.4%
- Cultural diversity: 8.0%
- Quality of Education: 7.1%
- Quality of roads and infrastructure: 4.1%
- Well-planned growth: 3.3%
- Youth programs: 1.3%
- Other: 5.1%
- DK/NA: 2.3%
As in the previous question, the residents were asked in an open-end format with multiple responses allowed, to indicate what they like least about their city or town. The most frequently given response was “Air quality” at 32.0%, followed by “Crime rate” at 30.0%. The next tier of responses were “Gang violence” at 20.9%, “Job opportunities” at 18.3%, “Lack of community resources” at 12.3%, and “Growth and planning” at 10.9%. All other features garnered less than ten percent mentions.

The chart illustrating the results can be found on the following page.
Q4. Least Liked Features of City or Town (n=1,328) Continued

- Air quality: 32.0%
- Crime rate: 30.0%
- Gang violence: 20.9%
- Job opportunities: 18.3%
- Lack of community resources (hospitals and...): 12.3%
- Growth and planning: 10.9%
- Traffic congestion: 9.3%
- Public transportation (bus, train, and bike lanes): 7.5%
- Housing affordability: 7.1%
- Youth programs (education and recreation for...): 6.8%
- Cost of living: 6.2%
- Farm land (loss of farms to development): 4.0%
- Other: 19.2%
- DK/NA: 5.8%
Next, the residents were asked to look forward to the next 20 years and rate the importance of specific issues with respect to improving the future quality of life in Kern County. Results are presented on the following pages, and grouped by similar sets of issues. At the end of this section, there are tables showing all of the issues examined in this portion of the survey, segmented by gender, age, region, ethnicity, and household income.

In the first set of issues, Economic Vitality and Equitable Services, two issues reached nearly identical levels of importance as in 2016. Further, the highest rated issue, “Creating more high paying jobs (5A)” (mean score of 3.45) received an “Extremely important” rating by more than 60% of residents while “Encouraging new businesses to relocate to County (5B)” (mean score of 3.29) garnered an “Extremely important” by more than 50% of residents.

The data are presented on the following pages for each of the specific issues included in the Economic Vitality and Equitable Services grouping in the form of a summary chart, comparative table, and subgroup comparisons. This format is followed for each of the issue sections.

The next section of the survey encompassed Transportation Choices. Residents were asked to rate the importance of issues relating to transportation choices for improving the future quality of life in Kern County. As in the previous sections, the results for the 2016 survey are presented on the following pages in the form of a summary chart, comparative table, and subgroup comparisons.

Once again, the results of the current survey are similar to the 2016 survey, with only one of the seven issues garnering a mean score of at least three on a scale of zero to four. “Maintaining local streets and roads (5G),” earned a mean score of 3.41 and an “Extremely Important” rating from more than half of the residents.

Following this issue was “Maintaining and improving sidewalks and bike lanes (5J)” (mean score of 2.97), “Expanding highways (5E)” (mean score of 2.79), “Improving public transportation to other cities (5I)” (mean score of 2.76), “Reducing traffic congestion (5F)” (mean score of 2.68), and “Expanding local bus services (5H)” (mean score of 2.66). Each of these issues garnered an “Extremely Important” rating of more than three out of ten residents.

The last issue, “Providing public transportation, carpooling, and other alternatives to driving alone (5K)” (mean score of 2.63) achieved an “Extremely Important” rating by nearly 30% of the residents.
Q5. Transportation Choices
(n=1,328) Continued

Expanding local bus services (5H)
Maintaining local streets and roads (5G)
Reducing traffic congestion (5F)
Expanding highways (5E)

Note: The above rating questions have been abbreviated for charting purposes, and responses were recoded to calculate mean scores:
“Extremely Important 4” = +4, “3” = +3, “2” = +2, “1” = +1, and “Not at all Important 0” = 0

The following set of issues in the survey concerned conserving undeveloped land and natural resources for improving the future quality of life in Kern County.

As seen in the previous sections, results of the 2017 survey are nearly identical to 2016 results. All four issues achieved a mean score of at least three on a scale of zero to four. The highest scoring issues were “Preserving water supply (5M)” with a mean score of 3.67 and ”Improving air quality (5L)” at 3.43, both with “Extremely Important” ratings from more than seven of ten residents. These were followed by “Improving water quality (5N)” at 3.43 and “Preserving open spaces, native animal habitats (5O)” at 3.03, which were rated as “Extremely Important” by more than 60% and 40% of residents, respectively.

The results are shown on the following pages in the form of a summary chart, comparative table, and subgroup comparisons.

Q5. Use Compact, Efficient Development Where Appropriate and Provide a Variety of Housing Choices (n=1,328)

The survey next asked the residents to indicate the level of importance for use of compact, efficient development where appropriate and providing a variety of housing choices for improving the future quality of life in Kern County. This issue, “Developing a variety of housing options, including apartments, townhomes and condominiums (5P),” achieved a mean score of 2.57, essentially identical with 2016 results. This issue garnered an “Extremely Important” rating from nearly 30% of the residents.

The results are presented on the following pages in the form of a summary chart, comparative table, and subgroup comparisons.

Q5. Services, Safety and Equity  
(n=1,328)

The last section of queried residents about the importance a variety of services, safety and equity issues for improving the future quality of life in Kern County. The results are presented on the following pages in the form of a summary chart, comparative table, and subgroup comparisons.

Each of the four issues tested in the current survey reached nearly identical importance ratings when compared with 2016.

The top two issues were “Improving the quality of public education (5T)” with a mean score of 3.60, followed by “Improving crime prevention and gang prevention programs (5S)” with a mean score of 3.55. These two issues both received an “Extremely Important” rating from more than 70% of residents. Following these issues are “Improving local health care and social services (5R)” with a mean score of 3.32 and “Improving fire and emergency medical services (5Q)” with a mean score of 3.30, and they received an “Extremely Important” rating from more than half of the residents.
Q5. Services, Safety and Equity (n=1,328) Continued

Improving fire and emergency medical services (5Q)
- 2017: 3.3
- 2016: 3.25
- 2015: 3.24

Improving local health care and social services (5R)
- 2017: 3.32
- 2016: 3.27
- 2015: 3.30

Improving crime prevention & gang prevention pgms (5S)
- 2017: 3.55
- 2016: 3.56
- 2015: 3.42

Improving the quality of public education (5T)
- 2017: 3.6
- 2016: 3.60
- 2015: 3.59

Improving local libraries (5U)
- 2017: 2.82
- 2016: 2.82
- 2015: 2.82

Note: The above rating questions have been abbreviated for charting purposes, and responses were recoded to calculate mean scores:
“Extremely Important 4” = +4, “3” = +3, “2” = +2, “1” = +1, and “Not at all Important 0” = 0

Q5. Importance of Specific Issues in Next 20 Years
Top Rated Issues

The survey assessed the importance of 20 issues related to improving the future quality of life in Kern County, which were tracked with results from previous surveys. While these issues were not grouped when presented to the survey respondent, they have been grouped into the six topic areas: (a) Economic Vitality and Equitable Services; (b) Community Assets and Infrastructure; (c) Transportation Choices; (d) Conserving Undeveloped Land and Natural Resources; (e) Use Compact, Efficient Development Where Appropriate and Provide Variety of Housing Choices; and (f) Services and Public Safety.

➢ The top seven rated issues, across categories, reflect nearly the same responses as in 2016, albeit in a slightly different order:
  - “preserving water supply” (3.67 on a scale of 4 to 0)
  - “improving the quality of public education” (3.60)
  - “improving crime prevention and gang prevention programs” (3.55)
  - “improving air quality” (3.46)
  - “creating more high paying jobs” (3.45)
  - “improving water quality” (3.43)
  - “maintaining local streets and roads” (3.41)

Q6. Primary Type of Transportation Used Traveling to Work or School (n=1,328) Continued
When the data is examined in terms of gender, men were more likely to indicate they primarily drive alone to work or school. Women tended to indicate more frequently that they use public transit or either work from home or don’t work outside the home. Residents who indicated a gender of “Other” were more likely to carpool.

Q6. Primary Type of Transportation Used Traveling to Work or School
Age Comparisons

The youngest (18 to 24) and oldest (85 and older) residents were more likely to use public transit. The 18-to-64-year-olds had a higher tendency to drive alone, while the 60-to-84-year-olds more frequently said that they work from home or don’t work outside the home, probably due to a preponderance of retirees in this category.

Q7. Secondary Type of Transportation Used Traveling to Work or School (n=1,191)

Next, residents were asked what secondary types of transportation they used for traveling to work or school. As seen in 2016, the most frequently given response was that they carpool at 23.9%, followed by public transit at 11.4% and walking at 9.3%. All other responses garnered less than six percent mentions,
Q7. Secondary Type of Transportation Used Traveling to Work or School
Gender Comparisons

When looking at the data in terms of gender, men were more likely to report using a bike as a secondary transit mode, while women tended to indicate they prefer public transit, taxi, or walking.

Next, residents were asked to rate the flow of traffic in their city or town. In the current survey, there was a small positive rating shift compared to 2016 results. There was a slight increase the number of residents who said “Good” 42.8% in 2017 (vs. 39.7% in 2016), and a sizable decrease in the number of residents who indicated a response of “Fair” (34.2% in 2017 vs. 40.4% in 2016). Consistent with previous survey results, less than ten percent said traffic flow was “Poor.”
Q8. Rating of Traffic Flow in City or Town

Q10. Average Commute Miles  
(n=1,147)

There were some small but statistically significant differences in responses in the current survey when compared with 2016. For instance, more residents currently indicated they commute five miles or less and 21 to 41 miles than did in 2016.

The results are illustrated on the following pages.

As a follow up, residents who said they drive alone to work or school in response to Question 6 were asked what type of alternative transportation to driving alone they would choose if it was available in their area. As in previous years, “Carpool or vanpool” was the most popular response given to this question. However, significantly fewer residents mentioned this response in comparison to previous years (17.5% in 2017 vs. 25.0% in 2016), and there is a noticeable decline in this response over the past years. In addition, slightly fewer residents indicated they would walk, while more residents gave the response “None of the above.” Further, 5.3% of residents surveyed reported they would use Uber or Lyft as alternative transportation.

The results are illustrated in a chart on the following page.
Q11. Most Likely Alternative Transportation (drive alone only from Q6) (n=988) Continued

- Carpool or vanpool

Q13. Current Housing Type

As seen in previous years, the most popular housing type was a single-family home with a large yard, followed by a single-family home with a small yard. Response levels for each housing type are largely similar to 2015, but there was a slight increase in those who said they currently live in a single-family home with a small yard and a slight decrease in those who said they live in an apartment.
Q13. Current Housing Type

Examined in terms of length of residence in Kern County, the results reveal that residents who have lived in the County for ten or more years were more likely to state that they live in a single-family home with a large yard. However, residents of the County for one to ten years tended to more frequently report that they live in an apartment.

Q14. Housing Option Preferences
Gender Comparisons

In terms of gender, women and those who indicated the gender “Other,” were more likely to be open to the townhouse/condominium and apartment housing options. On the other hand, those who indicated the gender “Other” had a higher tendency to report interest in housing in the mixed-use building option. The data continues on the next page.

Q14. Housing Option Preferences
Age Comparisons

In general, the younger residents were more likely to indicate higher levels of interest for a single-family home with a large yard, mixed use buildings, and apartments. On the other hand, older residents tended to express less interest in these housing options, as well as townhouses or condominiums. Older residents tended to also be less enamored with single-family homes with large yards. The data table begins below and continues on the following page.

<table>

</table>
In terms of geographical regions, residents of West Kern and Central Valley areas were more likely to indicate a “Probably yes” response to relocating to a townhouse/condominium or apartment. Mountains residents had a greater tendency to say “No” to the townhouse or condominium option, while East Kern residents tended to more frequently give a “Probably yes” response to moving to a single-family home with a large yard. The table of results is continued on the next page.

</table>
When we segment housing preferences by current housing type, we find that large majorities of those living in a single-family home with a small yard, those living in single-family home with a large yard, and those living in a townhouse, condo or apartment would prefer a single-family home with a large or small yard. While smaller majorities of those living in a townhome, condo or apartment would prefer to remain in a townhome or condo. Those living in a mixed-use building are too small to make meaningful comparisons.

</table>
Asian and Hispanic or Latino residents were more likely to favor a single-family home with a small yard. Hispanic or Latino residents also were interested in the single-family home with a large yard and apartments, while Caucasian or White residents were more likely to say “No” to both of these options. Mixed-use buildings tended to be favored by Asian residents. The data table follows and continues on the next page.

Appendix B: Detailed Methodology
Survey Methodology

Survey Parameters

The respondents were selected using a random sample of voter file numbers, and a supplemental list of Hispanic surname residents. Interviewers first asked potential respondents a series of questions referred to as “Screeners.” These questions were used to ensure that the person lived in Kern County and was at least 18 years of age. Additionally, in order to ensure that the sample was representative of the ethnicity of the County population, 84 interviews were conducted in Spanish.

Overall, 1,328 residents in Kern County completed the survey, representing the population of approximately 609,827 adult residents. The study parameters resulted in a margin of error of plus or minus 2.69 percent. Interviews were conducted from January 28 to February 12, 2017, and the average interview time was 22 minutes. Interviews were conducted in either Spanish (n = 84) or English (n = 1,244), depending on the preference of the resident who was surveyed.

In order to allow segmentation of the results by region of Kern County, three areas of the County were over-sampled. During the study, oversamples were completed in each of the following regions – West Kern (n=218), Mountains (n=225), and East Kern (n=218), and the remaining interviews were completed in the Central Valley region (n=667). For the overall results presented in this report, the over-sampling was corrected by statistically weighting the data by region.

Sample and Weighting

Once collected, the sample of respondents was compared with the actual adult population of Kern County (weighted to the 2015 American Community Survey (ACS) for gender, age and ethnicity) to examine possible differences between the demographics of the sample of respondents and the actual County population. In addition, the data were weighted to the 2010 Census data for region of residence. The data were weighted to correct differences, and the results presented are representative of the adult population of Kern County in terms of gender, age, ethnicity and region of residence.

Questionnaire Methodology

To avoid the problem of systematic position bias, where the order in which a series of questions is asked systematically influences the answers, several questions in the survey were randomized such that the respondents were not consistently asked the questions in the same order. The series of items in Questions 3, 4, 5, 13, and 14 were randomized to avoid such position bias.

Questions 3, 4 and G allowed the residents surveyed to mention multiple responses. For this reason, the response percentages sum to more than 100, and these represent the percent of residents who mentioned a particular response, rather than the percent of total responses.
Margin of Error I

Because a survey typically involves a limited number of people who are part of a larger population group, by mere chance alone there will almost always be some differences between a sample and the population from which it was drawn. These differences are known as “sampling error” and they are expected to occur regardless of how scientifically the sample has been selected. The advantage of a scientific sample is that we are able to calculate the sampling error. Sampling error is determined by four factors: the population size, the sample size, a confidence level, and the dispersion of responses.

For example, the following table shows the possible sampling variation that applies to a percent result reported from a probability type sample. Because the sample of 1,328 adult residents age 18 or older was drawn from the estimated population of Kern County of approximately 609,827 adult residents, one can be 95% confident that the margin of error due to sampling will not vary, plus or minus, by more than the indicated number of percent points from the result that would have been obtained if the interviews had been conducted with all persons in the universe. As the table on the following page indicates, the margin of error for all aggregate responses is between 1.61 and 2.69% for the survey.

This means that, for a given question with dichotomous response options (e.g., Yes/No) answered by 1,328 respondents, one can be 95% confident that the difference between the percent breakdowns of the sample and those of the total population is no greater than 2.69%. The percent margin of error applies to both sides of the answer, so that for a question in which 50% of respondents said yes, one can be 95% confident that the actual percent of the population that would say yes is between 47% (50 minus 2.69) and 53% (50 plus 2.69).

The margin of error for a given question also depends on the distribution of responses to the question. The 2.69% refers to dichotomous questions where opinions are evenly split in the sample with 50% of respondents saying yes and 50% saying no. If that same question were to receive a response in which 10% of the respondents say yes and 90% say no, then the margin of error would be no greater than plus or minus 1.61%. As the number of respondents in a particular subgroup (e.g., age) is smaller than the number of total respondents, the margin of error associated with estimating a given subgroup’s response will be higher. Due to the high margin of error, Godbe Research cautions against generalizing the results for subgroups that are comprised of 25 or fewer respondents.

</table>
The questions discussed and analyzed in this report comprise a subset of various crosstabulation tables available for each question. Only those subgroups that are of particular interest or that illustrate particular insights are included in the discussion. Should readers wish to conduct a closer analysis of subgroups for a given question, the complete breakdowns appear in Appendix E. These crosstabulation tables provide detailed information on the responses to each question by demographic and behavioral groups that were assessed in the survey. A typical crosstabulation table is shown here.

A short description of the item appears on the left-hand side of the table. The item sample size \((n = 1,201)\) is presented in the first column of data under “Total.”

The results to each possible answer choice of all respondents are presented in the first column of data under “Total.” The aggregate number of respondents in each answer category is presented as a whole number, and the percent of the entire sample that this number represents is just below the whole number. In this example, among the total respondents, 472 respondents reported their “very satisfied” response, and this number of respondents equals 39.3\% of the total sample size of 1,201. Next to the “Total” column are the other columns representing responses from the male and female respondents. The data from these columns are read in exactly the same fashion as the data in the “Total” column, although each group makes up a smaller percent of the entire sample.
Subgroup Comparisons

To test whether or not the differences found in percent results among subgroups are likely due to actual differences in opinions or behaviors – rather than the results of chance due to the random nature of the sampling design – a “z-test” was performed. In the headings of each column are labels, “A,” “B,” “C,” etc. along with a description of the variable. The “z-test” is performed by comparing the percent in each cell with all other cells in the same row within a given variable (within Respondent’s Gender in the pictured table, for example).

The results from the “z-test” are displayed in a separate table below the crosstabulation table. If the percent in one cell is statistically different from the percent in another, the column label will be displayed in the cell from which it varies significantly. For instance, in the adjacent table, a significantly higher percent of men (44.7%) reported “somewhat satisfied” than women (39.4%). Hence, the letter “B,” which stands women, appears under Column “A,” which stands for men. The letters in the table indicate the differences where one can be 95% confident that the results are due to actual differences in opinions or behaviors reported by subgroups of respondents.

It is important to note that the percent difference among subgroups is just one piece in the equation to determine whether or not two percentage figures are significantly different from each other. The variance and sample size associated with each data point is integral to determining significance. Therefore, two calculations may be different from each other, yet the difference may not be statistically significant according to the “z” statistic.
In addition to the analysis of the percent of the responses, some results are discussed with respect to an average score. To derive the overall importance of an issue, Q5 for example, a number value was assigned to each response category – in this case,

- “Extremely Important 4” = +4,
- “3” = +3,
- “2” = +2,
- “1” = +1,
- “0” = “Not Important”

The number values that correspond to respondents’ answers were then averaged to produce a final score that reflects the overall importance of an issue. The resulting mean score makes the interpretation of the data considerably easier.

In the crosstabulation tables for Questions 5 of the survey, the reader will find mean scores. These mean scores represent the average response of each group. The table to the right shows the scales for each corresponding question. Responses of “DK/NA” were not included in the calculations of the means for any question.
Means Comparisons

A typical crosstabulation table of mean scores is shown in the adjacent table. All subgroups of interest concerning questions 5 are included in Appendix E.

The aggregate mean score for each item in the question series is presented in the first column of the data under “Total.” For example, among all the survey respondents, the feature, “Providing programs to improve energy efficiency,” earned a mean score of 1.3. Next to the “Total” column are other columns representing the mean scores assigned by the respondents grouped by Gender.

The data from these columns are read in the same fashion as the data in the “Total” column. To test whether two mean scores are statistically different, a “t-test” is performed. As in the case of the “z-test” for percentage figures, a statistically significant result is indicated by the letter representing the data column.

Kern Council of Governments: 2017 Community Survey
Appendices C to F
May 2017
Appendix C: Topline Report
METHODOLOGY

Sample Universe:
- 609,827 Adults 18+
- The respondents were selected using random sample of voter file numbers, matched to update cell phone numbers and email addresses, and a listed sample of Hispanic residents, which insures that all residents are represented.

Sample Size:
- n=1,328
- In order to allow segmentation of the results by region of Kern County, the areas of the County were sampled as follows:
  - West Kern, n=218
  - Central Valley, n=467
  - Mountains, n=225
  - East Kern, n=218

Weighting:
- Data is weighted to the 2015 American Community Survey (ACS) for gender, age and ethnicity, and weighted to the 2010 Census data for region.

Margin of Error:
- ± 2.69%

Data Collection: Landline, n=707; Cell, n=314; Online, n=254; Text/Online, n=53
Languages: English, n=1,244; Spanish, n=84 based on respondent preference.

Interview Dates: Jan 28 to Feb 12, 2017
Phone Interview Length: 22-minutes

OVERALL SATISFACTION

1. To begin, what is your overall opinion of living in your city or town? Generally speaking are you satisfied or dissatisfied with the quality of life in your city or town?

## Importance of Specific Issues in the Next 20 Years

### Q5A. Creating more high paying jobs

- **Not Important**: 2.2% (29)
- **01**: 2.3% (30)
- **02**: 8.4% (111)
- **03**: 21.8% (290)
- **Extremely Important**: 64.7% (859)
- **DK/NA**: 0.6% (8)

### Q5B. Encouraging new businesses to relocate to the County in order to diversify the local economy

- **Not Important**: 2.4% (32)
- **01**: 3.0% (40)
- **02**: 11.6% (154)
- **03**: 27.5% (370)
- **Extremely Important**: 53.1% (705)
- **DK/NA**: 2.0% (26)

### Q5C. Revitalizing older neighborhoods and business districts that are becoming rundown

- **Not Important**: 2.5% (33)
- **01**: 2.5% (33)
- **02**: 13.8% (183)
- **03**: 36.8% (488)
- **Extremely Important**: 43.0% (571)
- **DK/NA**: 1.5% (20)

### Q5D. Creating more affordable housing

- **Not Important**: 5.8% (90)
- **01**: 5.0% (66)
- **02**: 19.6% (260)
- **03**: 25.1% (334)
- **Extremely Important**: 42.6% (565)
- **DK/NA**: 1.0% (13)

### Q5E. Expanding highways

- **Not Important**: 7.2% (95)
- **01**: 7.2% (95)
- **02**: 13.8% (183)
- **03**: 31.3% (416)
- **Extremely Important**: 43.0% (571)
- **DK/NA**: 1.5% (20)

### Q5F. Reducing traffic congestion

- **Not Important**: 8.9% (118)
- **01**: 8.9% (118)
- **02**: 21.4% (285)
- **03**: 31.3% (416)
- **Extremely Important**: 33.3% (442)
- **DK/NA**: 1.0% (13)

### Q5G. Maintaining local streets and roads

- **Not Important**: 1.6% (21)
- **01**: 1.6% (21)
- **02**: 3.3% (43)
- **03**: 32.6% (433)
- **Extremely Important**: 56.0% (744)
- **DK/NA**: 0.3% (4)

GENERAL EMAIL INVITATION

From: executive.director@kerncog.org
Reply to: executive.director@kerncog.org
Subject: Participate in this important study about our community

Dear [insert name],

The Kern Council of Governments has commissioned GRA and McGuire Research, independent research firms, to conduct research on important issues in your area.

Your individual responses are entirely confidential and will be used for research purposes only. Your data will not be sold or provided to anyone. You will not be approached for any other reason - we are only interested in your opinions.

For the individual named above, you can access the survey by simply clicking on the link below. If your email does not support links, cut and paste the entire link into your browser.

<survey link with unique voter file id>

We ask that you please complete the survey on or before ______, 2017, after which it will be closed.

Thank you in advance for your participation.

Regards,

Ahron Hakimi
Executive Director
Kern Council of Governments

Technical Issues: If you have technical issues or questions with the survey link, password or completing the survey form please contact Technical Assistance (pwood@mcguire-research.com).

Questions about the Agency or this Survey: If you have questions about the Kern Council of Governments or the purpose of this survey please contact: executive.director@kerncog.org

Note: Email addresses for this survey were obtained from public records at the Registrar of Voters in Kern County. If you no longer wish to receive invitations or reminders for this research please click HERE to unsubscribe.

GMAIL & AOL OPT-IN EMAIL INVITATION

From: executive.director@kerncog.org
Reply to: executive.director@kerncog.org
Subject: Participate in this important study about our community

Dear [insert name],

The Kern Council of Governments has commissioned GRA and McGuire Research, independent research firms, to conduct research on important issues in your area.

Your individual responses will be entirely confidential and will be used for research purposes only. We are not selling anything or asking you to donate anything and the data from these surveys will not be sold or provided to anyone. You will not be approached for any other reason - we are only interested in your opinions on these important community issues.

For the individual named above, if you would like to be included in this email list to receive and be able to participate in important community surveys such as this and future ones, then please click on this link below.

<survey link with unique voter file id>

If you click on the link above, then an email invite for this specific survey will be sent to you shortly. Thank you.

Sincerely,

Ahron Hakimi
Executive Director
Kern Council of Governments

Questions about the Agency or this Survey: If you have questions about the Kern Council of Governments or the purpose of this survey, please contact executive.director@kerncog.org.

Note: Email addresses for this survey were obtained from public records at the Registrar of Voters in Kern County. If you no longer wish to receive invitations or reminders for this research please click HERE to unsubscribe.
INTRODUCTION & SCREENERS

[ONLINE INTRODUCTION]
Thank you for your interest in taking our survey to help understand issues in Kern County. All of your answers to the survey will be kept strictly anonymous and confidential.

Survey Instructions:
Once you have answered all the questions on a page, click the "Next" button in the lower-left corner of the screen to continue. If you have any technical difficulties with the survey, please email: Technical Assistance.

[PHONE INTERVIEW]
Hello, May I speak with ___________? Hello, my name is _____________ and I'm calling on behalf of GRA, a public opinion research firm. We're conducting a survey concerning some important issues in Kern County, and we would like to hear your opinions, we really appreciate your time. [VOTER; ASK FOR SPECIFIC PERSON, IF NOT AVAILABLE SCHEDULE CALL BACK. LISTED: ASK FOR SPECIFIC PERSON IF NOT AVAILABLE ASK ANOTHER ADULT 18+ IN HOUSEHOLD]

[IF NEEDED]: This is a study about issues of importance in your community. It is a survey only and I am not selling anything.

[IF THE PERSON ASKS WHY YOU ONLY WANT TO TALK TO THE INDIVIDUAL LISTED ON THE SAMPLE, OR ASKS IF THEY ARE ABLE TO PARTICIPATE INSTEAD OF THE INDIVIDUAL, THEN SAY: "I'm sorry, but for statistical purposes this survey must only be completed by this particular individual."

[IF THE INDIVIDUAL SAYS THEY ARE AN ELECTED OFFICIAL, THANK THEM FOR THEIR TIME, POLITELY EXPLAIN THAT THE FOCUS OF THIS SURVEY IS ON THE PUBLIC'S PERCEPTION OF ISSUES, AND TERMINATE THE INTERVIEW.]

[IF THE INDIVIDUAL SAYS THEY ARE ON THE NATIONAL DO NOT CALL LIST, RESPOND BASED ON THE GUIDELINES FROM THE MARKETING RESEARCH ASSOCIATION. FOR EXAMPLE, IF THE INDIVIDUAL SAYS: "There's a law that says you can't call me," RESPOND WITH: "Most types of opinion research studies are exempt under the law that congress passed. That law was passed to regulate the activities of the telemarketing industry. This is a legitimate research call. Your opinions count!"]

Before we get started, I'd like to verify that you are eligible to complete the survey.

i. But first, I need to know if I have reached you on a cell phone, and if so, are you in a place where you can talk safely without endangering yourself or others?

Yes, cell and can talk safely ---------------------------- 1
Yes, cell but cannot talk safely ----------------------- 2
No, not on cell ---------------------------------------- 3
[DON'T READ] DK/NA/REFUSED ------------------------ 99

[ALL RESPONDENTS]

ii. Are you, or any member of your household, associated with any County or City government board, committee, or commission?

Yes-------------------------------------------------------- 1 [CONTINUE TO Qiii TEXT]
No-------------------------------------------------------- 2 [GO TO QA]
[ONLINE] Not sure / [PHONE DON'T READ] DK/NA ------------------ 99 [CONTINUE TO Qiii TEXT]

iii. Thank you for your time, but the focus of this survey is on the general public's opinion of local issues. Due to your response to this question, you are not eligible to complete the survey. Thank you again for your time. [TERMINATE]

A. Respondent's Gender [PHONE ONLY: RECORD BY VOICE]:

Male------------------------------------------------------ 1
Female---------------------------------------------------- 2

B. How many years have you lived in Kern County? [PHONE: DON'T READ CHOICES; ONLINE: SHOW LIST]

Less than one year ---------------------------------------- 1
One year to less than five years -------------------------- 2
Five years to less than ten years ------------------------ 3
10 years or more ---------------------------------------- 4
Do not live in Kern County ------------------------------- 5 [THANK & TERMINATE]

C. What is your home zip code?

<td>3</td>
</tr>
</tbody>
</table>

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

c. Not used in comparisons because its column proportion is equal to zero or one.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

### Notes

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

### Comparisons of Column Proportions\(^b,c\)

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- This category is not used in comparisons because its column proportion is equal to zero or one.
- Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
- Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

<td></td>
</tr>
</tbody>
</table>

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- **a.** Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
- **b.** Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

  - **Somewhat satisfied**
    - **Very dissatisfied**
      - DK/NA

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost table using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.
1. To begin, what is your overall opinion of living in your city or town? Generally speaking are you satisfied or dissatisfied with the quality of life in your city or town?

#### Other

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

---

**Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.**

- **a**. This category is not used in comparisons because its column proportion is equal to zero or one.
- **b**. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
- **c**. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Comparisons of Column Proportions

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.
### 3. What do you like MOST about your city or town?

| Cost of housing | Cost of living | Cultural diversity | Farming and agriculture | Location | Natural resources | Quality of Education | Quality of roads and infrastructure | Safe neighborhoods/communities | Sense of community | Small-town atmosphere | Weather and climate | Well-planned growth | Youth programs | Other | DK |
|-----------------|----------------|-------------------|-------------------------|----------|------------------|---------------------|-------------------------------|-------------------------------|-----------------|-------------------|---------------------|---------------------|------------------|---------|-----|----|

#### Results

3. What do you like MOST about your city or town?

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.
### Comparisons of Column Proportions

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- **a.** This category is not used in comparisons because its column proportion is equal to zero or one.
- **b.** Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- **c.** Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

3. What do you like MOST about your city or town?

- Cost of housing
- Cost of living
- Cultural diversity
- Farming and agriculture
- Location
- Natural resources
- Quality of Education
- Quality of roads and infrastructure
- Safe neighborhoods/communities
- Sense of community
- Small-town atmosphere
- Weather and climate
- Well-planned growth
- Youth programs
- Other
- DK

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

3. What do you like MOST about your city or town?

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.

b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
- b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Godbe Research /// Kern COG 2017 Community Survey /// Crosstabs 04-19-17

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because the sum of case weights is less than two.
b. This category is not used in comparisons because its column proportion is equal to zero or one.
c. Tests are adjusted for all pairwise comparisons within a row of each innermost table using the Bonferroni correction.
d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

</table>

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

</table>

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost table using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Comparison of Column Proportions

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Page 271
### Comparisons of Column Proportions

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

**Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.**

- **a.** This category is not used in comparisons because its column proportion is equal to zero or one.
- **b.** Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
- **c.** Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.
### Q5A. Creating more high paying jobs

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

This category is not used in comparisons because its column proportion is equal to zero or one.

Tests are adjusted for the design effect of the survey. Results may not sum to exactly 100% due to rounding.

Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

### Results
- Comparisons of Column Proportions
  - Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.
  - a. This category is not used in comparisons because its column proportion is equal to zero or one.
  - b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
  - c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. This category is not used in comparisons because the sum of weights is less than two.
- c. Tests are adjusted for all pairwise comparisons within a row of each innermost tabular using the Bonferroni correction.
- d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost subset using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

</tbody>
</table>

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

</table>

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

\(^a\) This category is not used in comparisons because its column proportion is equal to zero or one.

\(^b\) Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

\(^c\) Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

\textsuperscript{a}This category is not used in comparisons because its column proportion is equal to zero or one.

\textsuperscript{b}Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

\textsuperscript{c}Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

### Comparisons of Column Proportions

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the row of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for all pairwise comparisons within a row of each innermost category using the Bonferroni correction.
c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportion tests.

The table above displays the distribution of secondary modes of transportation for work or school, categorized by gender. Each category's proportion is calculated out of the total number of respondents.

#### Comparisons of Column Proportions

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Comparisons of Column Proportions

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

### Results

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- **a** Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
- **b** Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.
### Comparisons of Column Proportions

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

#### a.
Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

#### b.
Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

#### c.
Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Comparisons of Column Proportions:

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. This category is not used in comparisons because the sum of case weights is less than two.
c. Tests are adjusted for all pairwise comparisons within a row of each innonestable using the Bonferroni correction.
d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.
### Comparison of Column Proportions

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

**a.** This category is not used in comparisons because its column proportion is equal to zero or one.

**b.** Tests are adjusted for all pairwise comparisons within row of each interval, most suitable using the Bonferroni correction.

**c.** Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

### Question 7

7. What is the secondary mode of transportation that you typically use to go to work or school?

#### Comparisons of Column Proportions

- **Bike**
  - Present
  - Absent

- **Carpool**
  - Present
  - Absent

- **Drive alone (car, truck, motorcycle, scooter)**
  - Present
  - Absent

- **Public transit (bus or shuttle)**
  - Present
  - Absent

- **Taxi**
  - Present
  - Absent

- **Uber/Lyft**
  - Present
  - Absent

- **Walk**
  - Present
  - Absent

- **Other (SPECIFY)**
  - Present
  - Absent

- **Not sure/DK/NA**
  - Present
  - Absent

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

**a.** This category is not used in comparisons because its column proportion is equal to zero or one.

**b.** Tests are adjusted for all pairwise comparisons within row of each interval most suitable using the Bonferroni correction.

**c.** Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.
7. What is the secondary mode of transportation that you typically use to go to work or school?

### Comparisons of Column Proportions

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for multiple comparisons using the Bonferroni correction.
c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.
Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- This category is not used in comparisons because its column proportion is equal to zero or one.
- Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
- Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- **a.** This category is not used in comparisons because its column proportion is equal to zero or one.
- **b.** Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
- **c.** Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

### Comparisons of Column Proportions

| Total | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 | 15 | 16 | 17 | 18 | 19 | 20 | 21 | 22 | 23 | 24 | 25 | 26 | 27 | 28 | 29 | 30 | 31 |
|-------|---|---|---|---|---|---|---|---|---|---|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Total | 150 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 | 15 | 16 | 17 | 18 | 19 | 20 | 21 | 22 | 23 | 24 | 25 | 26 | 27 | 28 | 29 | 30 | 31 |

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. Tests are adjusted for all pairwise comparisons within each row of each innermost subtable using the Bonferroni correction.

b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

</tbody>
</table>

**Note:**
- Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.
- This category is not used in comparisons because its column proportion is equal to zero or one.
- Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
- Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

\textsuperscript{a} This category is not used in comparisons because its column proportion is equal to zero or one.

\textsuperscript{b} Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

\textsuperscript{c} Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

### Comparisons of Column Proportions

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- **a.** This category is not used in comparisons because its column proportion is equal to zero or one.
- **b.** Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
- **c.** Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost strata using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost stratum using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

9. On average, how many minutes do you spend traveling to and from work or school each day?

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

**Results are based on two-sided tests with significance level 0.05.**

- **a.** This category is not used in comparisons because its column proportion is equal to zero or one.
- **b.** Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- **c.** Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Comparisons of Column Proportions

b. Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion appears under the category with the larger column proportion.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

9. On average, how many minutes do you spend traveling to and from work or school each day?

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

</table>

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. This category is not used in comparisons because the sum of case weights is less than two.

c. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.

d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

- a. This category is not used in comparisons because its column proportion appears under the category with the larger column proportion.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

<td>.</td>
</tr>
</tbody>
</table>

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- This category is not used in comparisons because its column proportion is equal to zero or one.
- Tests are adjusted for all pairwise comparisons within a row of each innermost stratum using the Bonferroni correction.
- Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.
9. On average, how many minutes do you spend traveling to and from work or school each day?

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

9. On average, how many minutes do you spend travelling to and from work or school each day?

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.
9. On average, how many minutes do you spend traveling to and from work or school each day?
### Comparisons of Column Proportions

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- **a.** This category is not used in comparisons because its column proportion is equal to zero or one.
- **b.** Tests are adjusted for all pairwise comparisons within a row of each innermost table using the Bonferroni correction.
- **c.** Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

</tbody>
</table>

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.
### 10. On average, how many miles do you travel to and from work or school each day?

10. On average, how many miles do you travel to and from work or school each day?

Comparisons of Column Proportions

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.
10. On average, how many miles do you travel to and from work or school each day?

**Comparisons of Column Proportions**

- **A:** This category is not used in comparisons because its column proportion is equal to zero or one.
- **B:** Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- **C:** Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

10. On average, how many miles do you travel to and from work or school each day?
Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

10. On average, how many miles do you travel to and from work or school each day?
Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- This category is not used in comparisons because its column proportion is equal to zero or one.
- Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
- Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

**10. On average, how many miles do you travel to and from work or school each day?**

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- This category is not used in comparisons because its column proportion is equal to zero or one.
- Tests are adjusted for all pairwise comparisons within a row of each innermost table using the Bonferroni correction.
- Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

</table>

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

**Comparisons of Column Proportions**

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- **a**. This category is not used in comparisons because its column proportion is equal to zero or one.
- **b**. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
- **c**. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

### Comparisons of Column Proportions

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- This category is not used in comparisons because its column proportion is equal to zero or one.
- Tests are adjusted for all pairwise comparisons within a row of each innermost table using the Bonferroni correction.
- Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

#### 10. On average, how many miles do you travel to and from work or school each day?

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.
10. On average, how many miles do you travel to and from work or school each day?

#### Results

1. On average, how many miles do you travel to and from work or school each day?

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- **a**. This category is not used in comparisons because its column proportion is equal to zero or one.
- **b**. This category is not used in comparisons because the sum of case weights is less than two.
- **c**. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- **d**. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

#### 10. On average, how many miles do you travel to and from work or school each day?

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

10. On average, how many miles do you travel to and from work or school each day?
### Comparisons of Column Proportions

#### Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- **a.** This category is not used in comparisons because its column proportion is equal to zero or one.
- **b.** Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- **c.** Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

**Notes:**

- Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

*Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.*

- This category is not used in comparisons because its column proportion is equal to zero or one.
- Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

#### Comparisons of Column Proportions

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because the sum of case weights is less than two.

b. This category is not used in comparisons because its column proportion is equal to zero or one.

c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

</table>

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

**a.** This category is not used in comparisons because its column proportion is equal to zero or one.

**b.** Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.

**c.** Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

#### Results

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- **(A)**: This category is not used in comparisons because its column proportion is equal to zero or one.
- **(B)**: Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
- **(C)**: Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

</tbody>
</table>

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

</table>

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.

- Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

</table>

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.
