Godbe Research /// Kern COG 2017 Community Survey /// Crosstabs 04-19-17
Comparisons of Column Proportions ${ }^{\text {b,c }}$

|  |  | Survey Language |  |
| :---: | :---: | :---: | :---: |
|  |  | English | Spanish |
|  |  | (A) | (B) |
| 9. On average, how many minutes do you spend traveling to and from work or school each day? | 180 |  |  |
|  | 195 |  |  |
|  | 200 |  |  |
|  | 240 |  | a |
|  | 999 |  |  |

Results are based on two-sided tests with significan
level 0.05. For each significant pair, the key of the category with the smaller column proportion appears
under the category with the larger column proportion.
a. This category is not used in comparisons because its
column proportion is equal to zero or

Tests are adiusted for all parwise comp
b. Tests are adjusted for all pairwise comparisons within
a row of each innermost subtable using the Bonferroni a row of ead
correction.
c.Cell counts of some categories are not integers. They
were rounded to the neaerest integers before performing column proportions tests.

Comparisons of Column Proportions ${ }^{\text {b,c }}$

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.
a. This category is not used in comparisons because its column proportion is equal to $z$ ero or one
b.Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction. c.Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions
tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the
smaller column roportion appears under the category with the
larger column proportion larger column proportion.
a. This category is not used in comparisons because its column
proportion is equal to zero or one. proportion is equal to zero or one.
b.Tests are adjusted for all pairwise comparisons within a row using the Bonferroni correction. c.Cell counts of some categories are not integers. They were
rounded to the nearest integers before performing column proportions tests.

## Godbe Research /// Kern COG 2017 Community Survey I// Crosstabs 04-19-17

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion
a.This category is not used in comparisons because its column proportion is equal to zero or one.
b.Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction. c.Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions
tests.

Comparisons of Column Proportions ${ }^{\text {b,c }}$

Resultts are based on two-sided tests with significance level 0.05. For
each significant pair, the key of the category with the smaller column each significant pair, the key of the category with the smaller
proportion appears under the category with the larger column
proportion.
a. This category is not used in comparisons because its column
proportion is equal to zero or one.
pros
b.Tests are adjusted for all pairwise comparisons within a row of each
innermost subtable using the Bonferronic cell counts of some categories are not correction. to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.
a. This category is not used in comparisons because its column proportion is equal to zero or one.
b.Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction. c.Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions
tests.

Godbe Research /// Kern COG 2017 Community Survey I// Crosstabs 04-19-17
Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.
a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction. c.Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions
tests.

Results are based on two-sided tests with significance level 0.05 . For each significant pair, the key of the
category with the smaller column proportion appears under the category with the larger column proportion a. This category is not used in comparisons because its column proportion is equal to zero or one. b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
c.Cell counts of some categories are not integers. They were rounded to the nearest integers before
performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the
Results are based on two-sided tests with significance level 0.05. For each significant pair, the
category with the smaller column proportion appears under the category with the larger column
proportion.
a. This category is not used in comparisons because its column proportion is equal to zero or one. b.Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the
Bonferroni correction. Bonferroni correction.
c.Cell counts of some categories are not integers. They were rounded to the nearest integers before
performing column proportions tests.

Godbe Research /// Kern COG 2017 Community Survey I// Crosstabs 04-19-17
Comparisons of Column Proportions ${ }^{\text {b,c }}$

Godbe Research /// Kern COG 2017 Community Survey /// Crosstabs 04-19-17
Comparisons of Column Proportions ${ }^{\text {b,c }}$

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category

a. This category is not used in comparisons because its column proportion is equal to zero or one.
b.Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
c.Cell counts of some
column proportions tes

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller Results are based on two-sided tests with significance level 0.05. For each signific
column proportion appears under the category with the larger column proportion.
a. This category is not used in comparisons because its column proportion is equal to zero or one.
b.This category is not used in comparisons because the sum of case weights is less than two.
c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction d.Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions
tests. tests.

Godbe Research /// Kern COG 2017 Community Survey I// Crosstabs 04-19-17
Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.
a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction. c.Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions
tests.

Godbe Research /// Kern COG 2017 Community Survey /// Crosstabs 04-19-17
Comparisons of Column Proportions ${ }^{\text {b,c }}$

Results are based on two-sided tests with significan Revel 0.05. For each significant pair, the key of the
category with the smaller column proportion appears
under the category with the larger under the category with the larger column proportion.
a. This category is not used in comparisons because its
column proportion is equal to zero or one.
b. Tests are adjusted for all pairwise comparisons within
a row of each innermost subtable using the Bonferroni correction.
c.Cell counts of some categories are not integers. They
were rounded to the nearest integers before performing were rounded to the nearest integers before performing
column proportions tests.

Comparisons of Column Proportions ${ }^{\text {b,c }}$
 significant pair, the key of the category with the smaller column.
appears under the category with the larger column proportion.
a. This category is not used in comparisons because its column proportion
is equal to zero or one. is equal to zero or one.
b.Tests are adjusted for all pairwise comparisons within a row of each
innermost subtable using the Bonferroni correction.
innermost subtable using the Bonferroni correction.
c.Cell counts of some categories are not integers. They were rounded to
the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller Results are based on two-sided tests with significance level 0.05 . For each sign
column proportion appears under the category with the larger column proportion.
a. This category is not used in comparisons because its column proportion is equal to zero or one
b.This category is not used in comparisons because the sum of case weights is less than two.
c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions
tests.

Godbe Research /// Kern COG 2017 Community Survey /// Crosstabs 04-19-17
Comparisons of Column Proportions ${ }^{\text {b,c }}$

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller Results are based on two-sided tests with significance level 0.05 . For each signift
column proportion appears under the category with the larger column proportion.
a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
c.Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

|  | DK/NA |  | a |  | a |  | a | a | a |

Results are based on two-sided tests with significance level 0.05 . For each significant pair, the key of the category with the smaller
column proportion appears under the category with the larger column proportion. column proportion appears under the category with the larger column proportion.
a. This category is not used in comparisons because its column proportion is equal to zero or one.
b.Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05 . For each significant pair, the key of the category with the smaller
column proportion appears under the category with the larger column proportion.
a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions
tests.

Godbe Research /// Kern COG 2017 Community Survey /// Crosstabs 04-19-17
Results are based on two-sided tests with significance level 0.05 . For each significant pair, the key of the category with the smaller
column proportion appears under the category with the larger column proportion. column proportion appears under the category with the larger column proportion.
a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
c.Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions
tests.

Comparisons of Column Proportions ${ }^{\text {b,c }}$

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category
with the smaller column proportion appears under the category with the larger column proportion.
a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni
c.Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Comparisons of Column Proportions ${ }^{\mathrm{c}, \mathrm{d}}$

Comparisons of Column Proportions ${ }^{\mathrm{c}, \mathrm{d}}$

## Godbe Research /// Kern COG 2017 Community Survey /// Crosstabs 04-19-17

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.
a. This category is not used in comparisons because the sum of case weights is less than two.
b. This category is not used in comparisons because its column proportion is equal to zero or one
c.Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
d.Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions
tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.
a.This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction c.Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions
tests.

Results are based on two-sided tests with significance level 0.05 . For each significant pair, the kej .
with the smaller column proportion appears under the category with the larger column proportion.
a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni
c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing
column proportions tests.

|  | DK |  |  |  |

Results are based on two-sided tests with significance level 0.05. For each significant pair, the
key of the category with the smaller column proportion appears under the category with the key of the category with
larger column proportion.
a. This category is not used in comparisons because its column proportion is equal to zero or
one.
b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable
using the Bonferroni correction using the Bonferroni correction.
c.Cell counts of some categories are not integers. They were rounded to the nearest integers
before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05 . For each significant pair, the key of the category with the smaller
column proportion appears under the category with the larger column proportion. column proportion appears under the category with the larger column proportion.
a. This category is not used in comparisons because its column proportion is equal to zero or one
b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
c.Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions
tests.

Comparisons of Column Proportions ${ }^{\text {b,c }}$

Results are based on two-sided tests with significance level 0.05 . For each significant pair, the key of the category with the smaller
column proportion appears under the category with the larger column proportion column proportion appears under the category with the larger column proportion.
a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions
tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category
with the smaller column proportion appears under the category with the larger column With the smaller column proportion appears under the category with the larger column proportion.
a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni
correction. c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing
column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.
a. This category is not used in comparisons because its column proportion is equal to zero or one.
b.Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
c.Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions

Results are based on two-sided tests with significance level 0.05 . For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.
a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions
tests.

## Godbe Research /// Kern COG 2017 Community Survey I// Crosstabs 04-19-17

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the categ with the larger column proportion
a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction. c.Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions
tests.

Comparisons of Column Proportions ${ }^{\text {a,b }}$

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column
proportion appears under the category with the larger column proportion
a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
b. Cell counts of some categories are not integers. They were rounded to
the nearest integers before performing column proportions tests.

|  |  | $\begin{aligned} & \text { Less than one } \\ & \text { year } \end{aligned}$ | One year to less than five years | Five years to less than ten years | Ten years or more |
|  |  | (A) | (B) | (C) | (D) |
| J. To wrap things up, what is your total annual household income? | Less than \$24,999 | a |  |  |  |
|  | \$25,000 to \$49,999 |  |  |  |  |
|  | \$50,000 to \$74,999 |  |  |  |  |
|  | \$75,000 to \$99,999 |  |  |  |  |
|  | More than \$100,000 |  |  |  |  |
|  | DK/NA | a |  |  |  |

Results are based on two-sided tests with significance level 0.05 . For each significant pair, the key of the category with
the smaller column proportion appears under the category with the larger column proportion.
a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni
correction.
c.Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column ns tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.
a. This category is not used in comparisons because its column proportion is equal to zero or one.
b.This category is not used in comparisons because the sum of case weights is less than two.
c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
d.Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions
tests.

Results are based on two-sided tests assuming equal variances with significance level 0.05 . For each significant pair, the key of the smaller category appears under the category with larger mean.
a. This category is not used in comparisons because the sum of case weights is less than two.
b.Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
c.Cell counts in some subtables are not integers. They were rounded to the nearest integers before performing pairwise comparisons.

Results are based on two-sided tests assuming equal variances with significance level 0.05. For each significant pair, the key of
the smaller category appears under the category with larger mean.
a.Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction
b. Cell counts in some subtables are not integers. They were rounded to the nearest integers before performing pairwise
comparisons. comparisons.
