**Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.**

- This category is not used in comparisons because its column proportion is equal to zero or one.
- Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
- Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

### Comparisons of Column Proportions

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- This category is not used in comparisons because the sum of case weights is less than two.
- This category is not used in comparisons because its column proportion is equal to zero or one.
- Tests are adjusted for all pairwise comparisons within a row of each innermost significant using the Bonferroni correction.
- Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

### Comparisons of Column Proportions

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost table using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Comparisons of Column Proportions

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

### Comparison of Column Proportions

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- **a**. This category is not used in comparisons because the sum of case weights is less than two.
- **b**. This category is not used in comparisons because its column proportion equal to zero or one.
- **c**. Tests are adjusted for all pairwise comparisons within a row of each innermost using the Bonferroni correction.
- **d**. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

#### Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- **a.** This category is not used in comparisons because its column proportion is equal to zero or one.
- **b.** Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- **c.** Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

#### Results

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. This category is not used in comparisons because the sum of case weights is less than two.
- c. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
- d. Cells counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

### F. How many motor vehicles does your household have?

#### Comparisons of Column Proportions

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost table using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

### Comparisons of Column Proportions

#### F. How many motor vehicles does your household have?

<table>
<thead>
<tr>
<th>None</th>
<th>One</th>
<th>Two</th>
<th>Three</th>
<th>Four or more</th>
<th>Not sure/DK/NA</th>
</tr>
</thead>
<tbody>
<tr>
<td>B</td>
<td>C</td>
<td>D</td>
<td>E</td>
<td></td>
<td></td>
</tr>
<tr>
<td>A</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

---

*Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion. For example, in the table for Drivers in Household, if category A has a smaller proportion than category B, then A is listed under B.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.*

Comparisons of Column Proportions

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- This category is not used in comparisons because its column proportion is equal to zero or one.
- Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.
### Comparisons of Column Proportions

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- **a.** This category is not used in comparisons because its column proportion is equal to zero or one.
- **b.** Tests are adjusted for multiple testing by the Bonferroni correction.
- **c.** Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for multiple comparisons within a row of each innermost suitable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

#### Notes

- **Comparisons of Column Proportions**
  - Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.
  - a. This category is not used in comparisons because its column proportion is equal to zero or one.
  - b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
  - c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

G. What ethnic group or groups do you consider yourself a part of?

Comparisons of Column Proportions:

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. This category is not used in comparisons because the sum of case weights is less than two.
- c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.
### Comparisons of Column Proportions

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

**a.** This category is not used in comparisons because its column proportion is equal to zero or one.

**b.** Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.

**c.** Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

#### Results

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because the sum of case weights is less than two.

b. This category is not used in comparisons because its column proportion is equal to zero or one.

c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Comparisons of Column Proportions

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for all pairwise comparisons within a row of each innermost table using the Bonferroni correction.
c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

### H. What is your age?

#### Comparisons of Column Proportions

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- **a.** This category is not used in comparisons because its column proportion is equal to zero or one.
- **b.** Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- **c.** Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

</table>

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

#### B. One

- This category is not used in comparisons because the sum of case weights is less than two.
- This category is not used in comparisons because its column proportion is equal to zero or one.
- Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

#### C. Two

- Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

\textsuperscript{a}This category is not used in comparisons because its column proportion is equal to zero or one.

\textsuperscript{b}Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.

\textsuperscript{c}Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.
### Comparisons of Column Proportions

**a.** This category is not used in comparisons because its column proportion is equal to zero or one.

**b.** Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

**c.** Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

**Comparisons of Column Proportions**

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- **a.** This category is not used in comparisons because its column proportion is equal to zero or one.
- **b.** Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- **c.** Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

### Results

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- This category is not used in comparisons because the sum of case weights is less than two.
- Tests are adjusted for all pairwise comparisons because its column proportion is equal to zero or one.
- Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

\hline
\multicolumn{2}{|c|}{Party by Gender} & Fem NPP & Male NPP & Fem Oth & Male Oth \\
\hline
\textbf{Total} & Less than $24,999 & $25,000 to $49,999 & $50,000 to $74,999 & $75,000 to $99,999 & More than $100,000 & DK/NA \\
\hline
\textbf{Total} & G & H & I & J & K & L \\
\hline
\end{tabular}
\end{center}

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

\begin{itemize}
\item a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
\item b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.
\end{itemize}

#### Comparisons of Column Proportions

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- **(A)** This category is not used in comparisons because its column proportion is equal to zero or one.
- **(B)** Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- **(C)** Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

## Page 1123
Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Comparisons of Column Proportions

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

</table>

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

c. This category is not used in comparisons because its column proportion is equal to zero or one.
Appendix F: Mean Score Crosstabs
| Q5A. Creating more high paying jobs | 3.45 3.45 |
| Q5B. Encouraging new businesses to relocate to the County in order to diversify the local economy | 3.29 3.29 |
| Q5C. Revitalizing older neighborhoods and business districts that are becoming rundown | 3.17 3.17 |
| Q5D. Creating more affordable housing | 2.93 2.93 |
| Q5E. Expanding highways | 2.79 2.79 |
| Q5F. Reducing traffic congestion | 2.68 2.68 |
| Q5G. Maintaining local streets and roads | 3.41 3.41 |
| Q5H. Expanding local bus services | 3.66 3.66 |
| Q5I. Improving public transportation to other cities | 2.76 2.76 |
| Q5J. Maintaining and improving sidewalks and bike lanes | 2.97 2.97 |
| Q5K. Providing public transportation, carpooling, and other alternatives to driving alone | 2.63 2.63 |
| Q5L. Improving air quality | 3.46 3.46 |
| Q5M. Preserving water supply | 3.67 3.67 |
| Q5N. Improving water quality | 3.43 3.43 |
| Q5O. Preserving open spaces and native animal habitats | 3.03 3.03 |
| Q5P. Developing a variety of housing options, including apartments, townhomes and condominiums | 2.57 2.57 |
| Q5Q. Improving fire and emergency medical services | 3.30 3.30 |
| Q5R. Improving local health care and social services | 3.32 3.32 |
| Q5S. Improving crime prevention and gang prevention programs | 3.55 3.55 |
| Q5T. Improving the quality of public education | 3.60 3.60 |
Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

Cell counts in some subtables are not integers. They were rounded to the nearest integers before performing pairwise comparisons.

![Comparisons of Column Means](image)

**Results are based on two-sided tests assuming equal variances with significance level 0.05. For each significant pair, the key of the smaller category appears under the category with larger mean.**

- a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- b. Cell counts in some subtables are not integers. They were rounded to the nearest integers before performing pairwise comparisons.

**Notes**

- Results are based on two-sided tests assuming equal variances with significance level 0.05. For each significant pair, the key of the smaller category appears under the category with larger mean.
- Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- Cell counts in some subtables are not integers. They were rounded to the nearest integers before performing pairwise comparisons.

Results are based on two-sided tests assuming equal variances with significance level 0.05. For each significant pair, the key of the smaller category appears under the category with larger mean.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.

b. Cell counts in some subtables are not integers. They were rounded to the nearest integers before performing pairwise comparisons.

Results are based on two-sided tests assuming equal variances with significance level 0.05. For each significant pair, the key of the smaller category appears under the category with larger mean.

a. This category is not used in comparisons because the sum of case weights is less than two.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.

c. Cell counts in some subtables are not integers. They were rounded to the nearest integers before performing pairwise comparisons.

Results are based on two-sided tests assuming equal variances with significance level 0.05. For each significant pair, the key of the smaller category appears under the category with larger mean.

\(^a\) Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.

\(^b\) Cell counts in some subtables are not integers. They were rounded to the nearest integers before performing pairwise comparisons.
a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

</table>

Results are based on two-sided tests assuming equal variances with significance level 0.05. For each significant pair, the key of the smaller category appears under the category with larger mean.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
b. Cell counts in some subtables are not integers. They were rounded to the nearest integers before performing pairwise comparisons.
Appendix C: Topline Report
METHODOLOGY

Sample Universe:
- 609,827 Adults 18+
- The respondents were selected using random sample of voter file numbers, matched to update cell phone numbers and email addresses, and a listed sample of Hispanic residents, which insures that all residents are represented.

Sample Size:
- n=1,328
- In order to allow segmentation of the results by region of Kern County, the areas of the County were sampled as follows:
  - West Kern, n=218
  - Central Valley, n=667
  - Mountains, n=225
  - East Kern, n=218

Weighting:
- Data is weighted to the 2015 American Community Survey (ACS) for gender, age and ethnicity, and weighted to the 2010 Census data for region.

Margin of Error:
- ± 2.69%

Data Collection: Landline, n=707; Cell, n=314; Online, n=254; Text/Online, n=53

Languages: English, n=1,244; Spanish, n=84 based on respondent preference.

Interview Dates: Jan 28 to Feb 12, 2017
Phone Interview Length: 22-minutes

CLIENT EMAIL SETUP INFORMATION

Step 1
The Kern Council of Governments will need to create a new email address for use by Godbe Research to send out email invitations. Unless already in use, this new email address should be:

executive.director@kerncog.org.

Step 2
After the email has been set up, have your IT Department forward all of the emails sent to the new account to: surveys.gra@gmail.com. We will handle any tech support questions sent to this account and forward any substantive emails that may require a response from a agency representative.

Step 3
Provide Godbe Research any email lists for matching with the voter file. The data needs to include separate fields for first name, last name, street address, and email address. However, if cell and landlines phones are available that is also very useful. The format in an excel files should be:

<table>
<thead>
<tr>
<th>First Name</th>
<th>Last Name</th>
<th>Email</th>
<th>Cell Phone</th>
<th>Home Phone</th>
<th>Street Address</th>
<th>City</th>
<th>State</th>
<th>Zip</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bryan</td>
<td>Godbe</td>
<td><a href="mailto:bgodbe@godberesearch.com">bgodbe@godberesearch.com</a></td>
<td>(650) 520-9150</td>
<td>(650) 288-3077</td>
<td>1575 Old Bayshore Highway</td>
<td>Burlingame</td>
<td>CA</td>
<td>94010</td>
</tr>
<tr>
<td>Leslie</td>
<td>Godbe</td>
<td><a href="mailto:lgodbe@godberesearch.com">lgodbe@godberesearch.com</a></td>
<td>(650) 533-2320</td>
<td>(650) 288-3041</td>
<td>1575 Old Bayshore Highway</td>
<td>Burlingame</td>
<td>CA</td>
<td>94010</td>
</tr>
</tbody>
</table>

Client Check List

- [ ] Set up email address.
- [ ] Auto forward all email from new account to surveys.gra@gmail.com.
- [ ] Notify Godbe Research on completion of above so the email can be tested.
- [ ] Send email list as discussed to Godbe Research.
GENERAL EMAIL INVITATION

From: executive.director@kerncog.org
Reply to: executive.director@kerncog.org
Subject: Participate in this important study about our community

Dear [insert name],

The Kern Council of Governments has commissioned GRA and McGuire Research, independent research firms, to conduct research on important issues in your area.

Your individual responses are entirely confidential and will be used for research purposes only. Your data will not be sold or provided to anyone. You will not be approached for any other reason - we are only interested in your opinions.

For the individual named above, you can access the survey by simply clicking on the link below. If your email does not support links, cut and paste the entire link into your browser.

<survey link with unique voter file id>

We ask that you please complete the survey on or before ______, 2017, after which it will be closed.

Thank you in advance for your participation.

Regards,
Ahron Hakimi
Executive Director
Kern Council of Governments

Technical Issues: If you have technical issues or questions with the survey link, password or completing the survey form please contact Technical Assistance (pwood@mcguire-research.com).

Questions about the Agency or this Survey: If you have questions about the Kern Council of Governments or the purpose of this survey please contact: executive.director@kerncog.org

Note: Email addresses for this survey were obtained from public records at the Registrar of Voters in Kern County. If you no longer wish to receive invitations or reminders for this research please click HERE to unsubscribe.

GMAIL & AOL OPT-IN EMAIL INVITATION

From: executive.director@kerncog.org
Reply to: executive.director@kerncog.org
Subject: Participate in this important study about our community

Dear [insert name],

The Kern Council of Governments has commissioned GRA and McGuire Research, independent research firms, to conduct research on important issues in your area.

Your individual responses will be entirely confidential and will be used for research purposes only. We are not selling anything or asking you to donate anything and the data from these surveys will not be sold or provided to anyone. You will not be approached for any other reason - we are only interested in your opinions on these important community issues.

For the individual named above, if you would like to be included in this email list to receive and be able to participate in important community surveys such as this and future ones, then please click on this link below.

<survey link with unique voter file id>

If you click on the link above, then an email invite for this specific survey will be sent to you shortly. Thank you.

Sincerely,

Ahron Hakimi
Executive Director
Kern Council of Governments

Questions about the Agency or this Survey: If you have questions about the Kern Council of Governments or the purpose of this survey, please contact executive.director@kerncog.org.

Note: Email addresses for this survey were obtained from public records at the Registrar of Voters in Kern County. If you no longer wish to receive invitations or reminders for this research please click HERE to unsubscribe.
INTRODUCTION & SCREENERS

[ONLINE INTRODUCTION]
Thank you for your interest in taking our survey to help understand issues in Kern County. All of your answers to the survey will be kept strictly anonymous and confidential.

Survey Instructions:
Once you have answered all the questions on a page, click the "Next" button in the lower-left corner of the screen to continue. If you have any technical difficulties with the survey, please email: Technical Assistance.

[PHONE INTERVIEW]
Hello, May I speak with __________? Hello, my name is ___________ and I’m calling on behalf of GRA, a public opinion research firm. We’re conducting a survey concerning some important issues in Kern County, and we would like to hear your opinions, we really appreciate your time. [VOTER; ASK FOR SPECIFIC PERSON, IF NOT AVAILABLE SCHEDULE CALL BACK. LISTED: ASK FOR SPECIFIC PERSON IF NOT AVAILABLE ASK ANOTHER ADULT 18+ IN HOUSEHOLD]

[IF NEEDED]: This is a study about issues of importance in your community. It is a survey only and I am not selling anything.

[IF THE PERSON ASKS WHY YOU ONLY WANT TO TALK TO THE INDIVIDUAL LISTED ON THE SAMPLE, OR ASKS IF THEY ARE ABLE TO PARTICIPATE INSTEAD OF THE INDIVIDUAL, THEN SAY: “I'm sorry, but for statistical purposes this survey must only be completed by this particular individual.”]

[IF THE INDIVIDUAL SAYS THEY ARE ON THE NATIONAL DO NOT CALL LIST, RESPOND BASED ON THE GUIDELINES FROM THE MARKETING RESEARCH ASSOCIATION. FOR EXAMPLE, IF THE INDIVIDUAL SAYS: “There’s a law that says you can't call me,” RESPOND WITH: “Most types of opinion research studies are exempt under the law that congress passed. That law was passed to regulate the activities of the telemarketing industry. This is a legitimate research call. Your opinions count!”].

Before we get started, I’d like to verify that you are eligible to complete the survey.

i. But first, I need to know if I have reached you on a cell phone, and if so, are you in a place where you can talk safely without endangering yourself or others?
Yes, cell and can talk safely ---------------------------- 1
Yes, cell but cannot talk safely ----------------------- 2 [CALL BACK LATER]
No, not on cell --------------------------------------------- 3
[DON’T READ] DK/NA/REFUSED ------------------- 99 [CALL BACK LATER]

ii. Are you, or any member of your household, associated with any County or City government board, committee, or commission?
Yes---------------------------------------------------------- 1 [CONTINUE TO Qii TEXT]
No----------------------------------------------------------- 2 [GO TO QA]
[ONLINE] Not sure / [PHONE DON’T READ] DK/NA -------------- 99 [CONTINUE TO Qii TEXT]

iii. Thank you for your time, but the focus of this survey is on the general public’s opinion of local issues. Due to your response to this question, you are not eligible to complete the survey. Thank you again for your time. [TERMINATE]

A. Respondent’s Gender[PHONE ONLY: RECORD BY VOICE]:
   Male ---------------------------------------------------------- 1
   Female ------------------------------------------------------- 2

B. How many years have you lived in Kern County? [PHONE: DON'T READ CHOICES; ONLINE: SHOW LIST]
Less than one year---------------------------------------- 1
One year to less than five years ----------------------- 2
Five years to less than ten years ---------------------- 3
10 years or more ------------------------------------------ 4
Do not live in Kern County ------------------------------ 5 [THANK & TERMINATE]

C. What is your home zip code?

OTHER 98 [THANK & TERMINATE]
OVERALL SATISFACTION

To begin, what is your overall opinion of living in your city or town?

1. Generally speaking are you satisfied or dissatisfied with the quality of life in your city or town?

   [PHONE: GET ANSWER, THEN ASK:] Is that very (satisfied/dissatisfied) or somewhat (satisfied/dissatisfied)?

   Very satisfied ___________________________ 1
   Somewhat satisfied _______________________ 2
   Somewhat dissatisfied ____________________ 3
   Very dissatisfied _______________________ 4

2. Looking ahead to the next 20 years, do you think the quality of life in your city or town will stay about the same as today, or will it be better or worse?

   [PHONE: ASK IF REPLY IS “BETTER” OR “WORSE”:] Is that much (better/worse) or somewhat (better/worse)?

   Much better ___________________________ 1
   Somewhat better _______________________ 2
   Stay about the same ____________________ 3
   Somewhat worse _______________________ 4
   Much worse ___________________________ 5

3. What do you like MOST about your city or town? [OPEN-ENDED QUESTION: RECORD MULTIPLE RESPONSES PHONE: DON'T READ CHOICES, ONLINE: SHOW CHOICES, RANDOMIZE]

   Cost of housing ________________________ 1
   Cost of living ____________________________ 2
   Cultural diversity ________________________ 3
   Farming and agriculture ___________________ 4
   Location _______________________________ 5
   Natural resources (outdoor recreation, rivers, trees, wildlife) ____________________________ 6
   Quality of Education _____________________ 7
   Quality of roads and infrastructure ________ 8
   Safe neighborhoods/communities ___________ 9
   Sense of community ______________________ 10
   Small-town atmosphere ___________________ 11
   Weather and climate _____________________ 12
   Well-planned growth _____________________ 13
   Youth programs _________________________ 14
   Other [SPECIFY: ______________________] _______ 98

4. What do you like LEAST about your city or town? [OPEN-ENDED QUESTION: RECORD MULTIPLE RESPONSES PHONE: DON'T READ CHOICES, ONLINE: SHOW CHOICES, RANDOMIZE]

   Air quality _____________________________ 1
   Cost of living ____________________________ 2
   Crime rate ______________________________ 3
   Farm land (loss of farms to development) ______ 4
   Gang violence ____________________________ 5
   Growth and planning ______________________ 6
   Housing affordability ______________________ 7
   Job opportunities _________________________ 8
   Lack of community resources (hospitals and social services) _____________________________ 9
   Public transportation (bus, train, and bike lanes) -10
   Traffic congestion ________________________ 11
   Youth programs (education and recreation for children/teens) __________________________ 12
   Other [SPECIFY: ______________________] _______ 98
IMPORTANCE OF SPECIFIC ISSUES IN NEXT 20 YEARS

5. Again, looking ahead to the next 20 years, here are a number of issues facing residents. Please rate the importance of each issue in improving the future quality of life in Kern County.

[ONLINE:] On a scale of 0 to 4, with 0 being not important to 4 being extremely important, how important are the following?

[PHONE:] On a scale of 0 to 4, with 0 being not important to 4 being extremely important, how important is __________? RESPONSE MUST BE A NUMBER; REPEAT THE SCALE TO PROMPT

HOUSING PREFERENCES

13. Next, I’d like to talk to you about a variety of housing issues. Do you currently live in

[READ ENTIRE LIST – RANDOMIZE ORDER]

- A single-family home with a small yard
- A single-family home with a large yard
- A townhouse or condominium
- A building with offices and stores on the first floor and condominiums on the upper floors
- An apartment

[DON’T READ] DK/NA

14. I’m going to read you a list of housing options. For each one, please tell me if you would
consider that type of housing if you were to relocate within Kern County in the next 10 years.

Given your household income, would you consider living in _________ if you were to
relocate within Kern County. [GET ANSWER, IF “YES,” THEN ASK:] Would that be
definitely yes or probably yes?

[RANDOMIZE]

---

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

</table>

**Results**

- Based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.
- **a.** This category is not used in comparisons because its column proportion is equal to zero or one.
- **b.** Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
- **c.** Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

### Comparisons of Column Proportions

**C. Zip Code Area**

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- **a**. This category is not used in comparisons because its column proportion is equal to zero or one.
- **b**. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- **c**. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

### Ethnic Group

</tr>
</tbody>
</table>

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- **a**. This category is not used in comparisons because the sum of case weights is less than two.
- **b**. This category is not used in comparisons because its column proportion is equal to zero or one.
- **c**. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- **d**. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

### Comparisons of Column Proportions

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

</tbody>
</table>

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

de. This category is not used in comparisons because its column proportion is equal to one or zero.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

</tbody>
</table>

2. Looking ahead to the next 20 years, do you think the quality of life in your city or town will stay about the same as today, or will it be better or worse?

- Much better: 4.6% DK/NA: 2.9%
- Somewhat better: 12.8% DK/NA: 4.0%
- Stay about the same: 15.3% DK/NA: 9.2%
- Somewhat worse: 29.5% DK/NA: 9.2%
- Much worse: 25.5% DK/NA: 10.2%

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

### Comparisons of Column Proportions \(^{c,d}\)

#### Comparisons of Column Proportions

- Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.
- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for multiple comparisons within a row of each innermost variable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

---

Results for the socioeconomic domains are based on aggregated national data from the Census. Results are adjusted for multiple comparisons using the Bonferroni correction. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.

b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

3. What do you like MOST about your city or town?

### Comparisons of Column Proportions

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.
### Quality of Education

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
- c. Cells counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

</table>

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because the sum of case weights is less than two.
b. This category is not used in comparisons because the column proportion is equal to zero or one.
c. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

</table>

\(^{a}\)Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

\(^{b}\)Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

### 4. What do you like LEAST about your city or town?

- **Air quality**
- **Cost of living**
- **Crime rate**
- **Farm land (loss of farms to development)**
- **Gang violence**
- **Growth and planning**
- **Housing affordability**
- **Job opportunities**
- **Lack of community resources (hospitals and social services)**
- **Public transportation (bus, train, and bike lanes)**
- **Traffic congestion**
- **Youth programs (education and recreation for children/teens)**
- **Other**
- **DK**

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

### Comparisons of Column Proportions

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

DK

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
- c. Cells counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Comparisons of Column Proportions

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

\textsuperscript{a}. This category is not used in comparisons because its column proportion is equal to zero or one.

\textsuperscript{b}. Tests are adjusted for all pairwise comparisons within a row of each innermost subsample using the Bonferroni correction.

\textsuperscript{c}. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- **a.** This category is not used in comparisons because its column proportion is equal to zero or one.
- **b.** Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- **c.** Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

</table>

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

\(^a\) This category is not used in comparisons because its column proportion is equal to zero or one.

\(^b\) Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.

\(^c\) Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

### Comparisons of Column Proportions

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.
## Q5A. Creating more high paying jobs

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.
### Q5A. Creating more high paying jobs

**Results are based on two-sided tests with significance level 0.05.**

- **a.** This category is not used in comparisons because its column proportion is equal to zero or one.
- **b.** Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
- **c.** Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. This category is not used in comparisons because the sum of case weights is less than two.

c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Q5Q. Improving fire and emergency medical services

- DK/NA
- Not Important
- Extremely Important

Q5R. Improving local health care and social services

- DK/NA
- Not Important
- Extremely Important

Q5S. Improving crime prevention and gang prevention programs

- DK/NA
- Not Important
- Extremely Important

Q5T. Improving the quality of public education

- DK/NA
- Not Important

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost table using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

**Q5Q. Improving fire and emergency medical services**

- Not Important: 1
- Extremely Important: 3
- DK/NA: A

**Q5R. Improving local health care and social services**

- Not Important: 1
- Extremely Important: 3
- DK/NA: A

**Q5S. Improving crime prevention and gang prevention programs**

- Not Important: 1
- Extremely Important: 3
- DK/NA: A

**Q5T. Improving the quality of public education**

- Not Important: 1
- Extremely Important: 3
- DK/NA: A

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

**Comparisons of Column Proportions**

- **Q5A. Creating more high paying jobs**
- **Q5B. Encouraging new businesses to relocate to the County in order to diversify the local economy**
- **Q5C. Revitalizing older neighborhoods and business districts that are becoming rundown**
- **Q5D. Creating more affordable housing**
- **Q5E. Expanding highways**
- **Q5F. Reducing traffic congestion**
- **Q5G. Maintaining local streets and roads**
- **Q5H. Expanding local bus services**
### Comparisons of Column Proportions

| Interview Type | 
|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|
|                | Online | (A) | Phone | (B) |                |                |                |                |                |                |                |                |
| Q5I. Improving public transportation to other cities | 1 | B | 3 | B | 1 | A | 2 | A | 3 | A | 1 | A |
| Q5J. Maintaining and improving sidewalks and bike lanes | 1 | B | 3 | B | 1 | B | 2 | B | 3 | B | 1 | B |
| Q5K. Providing public transportation, carpooling, and other alternatives to driving alone | 1 | B | 3 | B | 1 | B | 2 | B | 3 | B | 1 | B |
| Q5L. Improving air quality | 1 | B | 3 | B | 1 | B | 2 | B | 3 | B | 1 | B |
| Q5M. Preserving water supply | 1 | B | 3 | B | 1 | B | 2 | B | 3 | B | 1 | B |
| Q5N. Improving water quality | 1 | B | 3 | B | 1 | B | 2 | B | 3 | B | 1 | B |
| QSO. Preserving open spaces and native animal habitats | 1 | B | 3 | B | 1 | B | 2 | B | 3 | B | 1 | B |
| Q5P. Developing a variety of housing options, including apartments, townhomes and condominiums | 1 | B | 3 | B | 1 | B | 2 | B | 3 | B | 1 | B |

**Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.**

- **a.** This category is not used in comparisons because its column proportion is equal to zero or one.
- **b.** Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- **c.** Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

*Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.*

- **a.** This category is not used in comparisons because its column proportion is equal to zero or one.
- **b.** Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- **c.** Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- **a.** This category is not used in comparisons because its column proportion is equal to zero or one.
- **b.** Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- **c.** Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.
6. Next, think about your daily commute and local transportation issues. What is the primary mode of transportation that you typically use to go to work or school?

### Comparisons of Column Proportions

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

### Homeownership Status

- **Feb 15**: 332  | 179 | 153  

#### Notes

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.

b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

### Comparisons of Column Proportions

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. This category is not used in comparisons because the sum of case weights is less than two.
- c. Tests are adjusted for all pairwise comparisons within a row of each inomerest suitable using the Bonferroni correction.
- d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

#### Comparisons of Column Proportions

7. What is the secondary mode of transportation that you typically use to go to work or school?

- Bike
- Carpool
- Drive alone (car, truck, motorcycle, scooter)
- Public transit (bus or shuttle)
- Taxi
- Uber/Lyft
- Walk
- Work from home/don't work outside the home
- Other (SPECIFY)
- DK/NA

#### Comparisons of Column Proportions

8. Based on your personal experience, how would you rate traffic flow in your city or town? Is traffic flow excellent, good, fair, or poor?

- Excellent
- Good
- Fair
- Poor
- DK/NA

#### Results

- Excellent: 153
- Good: 491
- Fair: 392
- Poor: 106
- DK/NA: 5

#### Significant Comparisons

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

#### Comparisons of Column Proportions

- a. Tests are adjusted for all pairwise comparisons within a row of each innermost category using the Bonferroni correction.
- b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.
- c. This category is not used in comparisons because its column proportion appears under the category with the larger column proportion.

8. Based on your personal experience, how would you rate traffic flow in your city or town? Is traffic flow excellent, good, fair, or poor?

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
c. Cell counts of some categories are not integers. They were rounded to the nearest integer before performing column proportions tests.
Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its sum of case weights is less than two.
b. This category is not used in comparisons because its column proportion is equal to zero or one.
c. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.
9. On average, how many minutes do you spend traveling to and from work or school each day?

**Notes:**
- a: Indicates a significant difference between the column and row proportions.
- b: Indicates the expected proportion for the column.
- c: Indicates the expected proportion for the row.

**Comparisons:**
- (A) to (I) indicate the columns and rows being compared.
### Comparisons of Column Proportions

#### 18-24 25-34 35-44 45-54 55-59 60-64 65-74 75-84 85 and Over

<table>
<thead>
<tr>
<th>Age Group</th>

<td>200</td>
<td>240</td>
<td>999</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- **a.** This category is not used in comparisons because its column proportion is equal to zero or one.
- **b.** Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
- **c.** Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

9. On average, how many minutes do you spend traveling to and from work or school each day?

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.
9. On average, how many minutes do you spend traveling to and from work or school each day?

</tr>
</tbody>
</table>

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- This category is not used in comparisons because its column proportion is equal to zero or one.
- Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
- Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

9. On average, how many minutes do you spend traveling to and from work or school each day?

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost cell using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

9. On average, how many minutes do you spend travelling to and from work or school each day?
### Comparisons of Column Proportions

#### Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- This category is not used in comparisons because its column proportion is equal to zero or one.
- Tests are adjusted for pair wise comparisons within a row of each innermost suitable using the Bonferroni correction.
- Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

| 999   | 30  | 17 |
| 2.6%  | 2.9%| 2.4%|
9. On average, how many minutes do you spend traveling to and from work or school each day?

- This category is not used in comparisons because its column proportion is equal to zero or one.
- Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

**Note:**
- The table represents the distribution of average minutes spent traveling to and from work or school each day, categorized by different ethnic groups.
- The data includes the number of people and the percentage of time spent in each category.

</table>

*Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. This category is not used in comparisons because the sum of case weights is less than two.

c. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.

d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.*

</table>

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.
### Household Income

#### Results

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

9. On average, how many minutes do you spend traveling to and from work or school each day?

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of the innermost table using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.
10. On average, how many miles do you travel to and from work or school each day?

10. On average, how many miles do you travel to and from work or school each day?

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.
10. On average, how many miles do you travel to and from work or school each day?

### Comparisons of Column Proportions

<table>
<thead>
<tr>
<th>Age</th>
<th>Not sure/DK/NA</th>
</tr>
</thead>
<tbody>
<tr>
<td>J</td>
<td></td>
</tr>
</tbody>
</table>

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost table using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

</table>

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

10. On average, how many miles do you travel to and from work or school each day?
### Comparisons of Column Proportions

**A.** This category is not used in comparisons because its column proportion is equal to zero or one.

**B.** Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.

**C.** Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

### 10. On average, how many miles do you travel to and from work or school each day?

</tbody>
</table>

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

</table>
Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

**10. On average, how many miles do you travel to and from work or school each day?**

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

### Results

- **This category is not used in comparisons because its column proportion is equal to zero or one.**
- Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
- Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

### Comparisons of Column Proportions

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

**Not sure/DK/NA**

- Five or more
- Four
- Three
- Two
- One
- None

**Results are based on two-sided tests with significance level 0.05.** For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

10. On average, how many miles do you travel to and from work or school each day?

### Column Proportions Tests

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. This category is not used in comparisons because the sum of case weights is less than two.

c. Tests are adjusted for all pairwise comparisons within a row of the innermost subtable using the Bonferroni correction.

d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

</table>

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

10. On average, how many miles do you travel to and from work or school each day?
Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

<td>172</td>
<td>141</td>
<td>52</td>
<td>109</td>
<td>322</td>
<td>49</td>
</tr>
</tbody>
</table>

### Comparisons of Column Proportions

- Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.
- a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

### Respondent's Gender

Comparisons of Column Proportions<sup>c,a</sup>

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- This category is not used in comparisons because its column proportion is equal to zero or one.
- This category is not used in comparisons because the sum of case weights is less than two.
- Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
- Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Comparisons of Column Proportions

### Permanent Absentee Voter

**Walk**

11. Which of the following would you be most likely to use to travel to and from work or school if they were available in your area?

<table>
<thead>
<tr>
<th></th>
<th>A</th>
<th>B</th>
</tr>
</thead>
<tbody>
<tr>
<td>B (B)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

### Likely Absentee Voter

11. Which of the following would you be most likely to use to travel to and from work or school if they were available in your area?

<table>

</table>

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

c. This category is not used in comparisons because its column proportion is equal to zero or one.

11. Which of the following would you be most likely to use to travel to and from work or school if they were available in your area?

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

<td></td>
<td></td>
</tr>
</tbody>
</table>

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because the sum of case weights is less than two.
b. This category is not used in comparisons because its column proportion is equal to zero or one.
c. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
d. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

</tr>
</tbody>
</table>

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

\(a\) Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

\(b\) Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

<td>18</td>
<td>8</td>
<td>2.9%</td>
</tr>
</tbody>
</table>

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

#### Notes

- Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

### Results

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for multiple comparisons.
c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- Tests are adjusted for all pairwise comparisons within a row of each innermost tabulate using the Bonferroni correction.
- Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

**Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.**

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Q14E. An apartment

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

#### Q14E. An apartment

- **DEFINITELY YES**: 138
- **PROBABLY YES**: 1190
- **NO**: 138
- **DK/NA**: 138

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

</table>

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- This category is not used in comparisons because its column proportion is equal to zero or one.
- Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

</tr>
<tr>
<td>Own</td>
<td>A</td>
<td>B</td>
</tr>
<tr>
<td>DK/NA</td>
<td>E</td>
<td>F</td>
</tr>
</tbody>
</table>

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

#### Results

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

- This category is not used in comparisons because its column proportion is equal to zero or one.
- Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

F. How many motor vehicles does your household have?

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for all pairwise comparisons within a row of each innermost table using the Bonferroni correction.
c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

#### F. How many motor vehicles does your household have?

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each inernest suitable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

F. How many motor vehicles does your household have?

<table>
<thead>
<tr>
<th>Vehicles in Household</th>
<th>Total</th>
<th>None</th>
<th>One</th>
<th>Two</th>
<th>Three</th>
<th>Four</th>
<th>Five or more</th>
<th>Not sure/DK/NA</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total</td>
<td>1238</td>
<td>41</td>
<td>242</td>
<td>532</td>
<td>313</td>
<td>122</td>
<td>68</td>
<td>10</td>
</tr>
</tbody>
</table>

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

#### F. How many motor vehicles does your household have?

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

### Comparisons of Column Proportions

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- **a.** This category is not used in comparisons because its column proportion is equal to zero or one.
- **b.** Tests are adjusted for all pairwise comparisons within a row of each innermost table using the Bonferroni correction.
- **c.** Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- **a.** This category is not used in comparisons because its column proportion is equal to zero or one.
- **b.** Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- **c.** Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

**Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.**

- **a.** This category is not used in comparisons because its column proportion is equal to zero or one.
- **b.** Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
- **c.** Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. This category is not used in comparisons because its column proportion is equal to zero or one.
- b. Tests are adjusted for multi-way comparisons within a row of each innermost suitable using the Bonferroni correction.
- c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- This category is not used in comparisons because its column proportion is equal to zero or one.
- Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
- Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

*Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.*

*Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.*

### Comparisons of Column Proportions

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- Tests are adjusted for all pairwise comparisons within a row of each innermost tabular using the Bonferroni correction.
- Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

### H. What is your age?

Results are based on two-sided tests with significance level 0.05. For each significant pair, if the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- This category is not used in comparisons because its column proportion is equal to zero or one.
- Tests are adjusted for all pairwise comparisons within a row of each innermost table using the Bonferroni correction.
- Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Comparisons of Column Proportions

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
- Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

#### Results

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

#### Comparisons of Column Proportions

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.

c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

### Comparisons of Column Proportions

- Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.
- This category is not used in comparisons because its column proportion is equal to zero or one.
- Results are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

**a,** Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

**b,** Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- a. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

- b. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Comparisons of Column Proportions

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

a. This category is not used in comparisons because its column proportion is equal to zero or one.
b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
c. Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

a. This category is not used in comparisons because its column proportion is equal to zero or one.

b. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
### Voting Propensity

### Comparisons of Column Proportions

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

- Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests assuming equal variances with significance level 0.05. For each significant pair, the key of the smaller category appears under the category with larger mean.

- Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- Cell counts in some subtables are not integers. They were rounded to the nearest integers before performing pairwise comparisons.

</table>

Results are based on two-sided tests assuming equal variances with significance level 0.05. For each significant pair, the key of the smaller category appears under the category with larger mean.

a. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.

b. Cell counts in some subtables are not integers. They were rounded to the nearest integers before performing pairwise comparisons.

Results are based on two-sided tests assuming equal variances with significance level 0.05. For each significant pair, the key of the smaller category appears under the category with larger mean.

a. This category is not used in comparisons because the sum of case weights is less than two.
b. Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
c. Cell counts in some subtables are not integers. They were rounded to the nearest integers before performing pairwise comparisons.

### Results

Results are based on two-sided tests assuming equal variances with significance level 0.05. For each significant pair, the key of the smaller category appears under the category with larger mean.

- Tests are adjusted for all pairwise comparisons within a row of each innermost suitable using the Bonferroni correction.
- Cell counts in some subtables are not integers. They were rounded to the nearest integers before performing pairwise comparisons.
Survey Language | Total | English | Spanish  
--- | --- | --- | ---  
Q5A. Creating more high paying jobs | 3.45 | 3.43 | 3.67  
Q5B. Encouraging new businesses to relocate to the County in order to diversify the local economy | 3.29 | 3.27 | 3.46  
Q5C. Revitalizing older neighborhoods and business districts that are becoming rundown | 3.17 | 3.15 | 3.32  
Q5D. Creating more affordable housing | 2.93 | 2.87 | 3.42  
Q5E. Expanding highways | 2.79 | 2.73 | 3.26  
Q5F. Reducing traffic congestion | 2.68 | 2.66 | 2.88  
Q5G. Maintaining local streets and roads | 3.41 | 3.39 | 3.57  
Q5H. Expanding local bus services | 2.66 | 2.60 | 2.22  
Q5I. Improving public transportation to other cities | 2.76 | 2.70 | 3.26  
Q5J. Maintaining and improving sidewalks and bike lanes | 2.97 | 2.94 | 3.27  
Q5K. Providing public transportation, carpooling, and other alternatives to driving alone | 2.63 | 2.57 | 3.22  
Q5L. Improving air quality | 3.46 | 3.44 | 3.65  
Q5M. Preserving water supply | 3.67 | 3.65 | 3.84  
Q5N. Improving water quality | 3.43 | 3.41 | 3.64  
Q5O. Preserving open spaces and native animal habitats | 3.03 | 2.98 | 3.42  
Q5P. Developing a variety of housing options, including apartments, townhomes and condominiums | 2.57 | 2.52 | 3.00  
Q5Q. Improving fire and emergency medical services | 3.30 | 3.26 | 3.63  
Q5R. Improving local health care and social services | 3.32 | 3.30 | 3.55  
Q5S. Improving crime prevention and gang prevention programs | 3.55 | 3.54 | 3.70  
Q5T. Improving the quality of public education | 3.60 | 3.57 | 3.79
a. Tests are adjusted for all pairwise comparisons within a row of each innermost column using the Bonferroni correction.

b. Cell counts in some subtables are not integers. They were rounded to the nearest integers before performing pairwise comparisons.
